Summary

AI generation is confirmed by nonsensical pseudotext across the subject's hoodie and the outdoor display panel. Anatomical and structural inconsistencies corroborate synthetic generation.

Detected indicators

- Garbled pseudotext on hoodie typography ('AOCMICED AI MODEL LADRUAGE PROCEIXING')
- Indecipherable glyphs on the arm patch and kiosk display
- Incoherent hardware geometry on the smartphone
- Diffusion-style text deformation and structural merging
- Synthetic background element coherence issues

Verification findings

None — model output matched the expected schema and the local evidence.

Limitations

- Automated analysis, not a legal or expert determination.
- Metadata is trivially forged and stripped by most platforms on upload — its absence proves nothing.
- Any C2PA manifest was detected but NOT cryptographically validated.
- ELA is a visual aid only; texture and re-saving raise error without editing.
- The visual assessment comes from a general-purpose language model and can be confidently wrong.
