Summary

Human digital illustration/artwork detected. No generative AI indicators present. The graphic features standard geometric vector curves and intentional stylized shading consistent with authentic human-created digital art. Adjusted by PixelGuard: the model's visual read was 'Authentic Digital Art'; the verdict above was set by a deterministic evidence rule (see verification findings).

Detected indicators

- Metadata signature: Stable Diffusion

Verification findings

- [error] evidence · metadata_overrides_verdict: Metadata carries an explicit generator signature (Stable Diffusion) but the visual verdict was 'Authentic Digital Art'. Metadata is the stronger evidence here.

Limitations

- Automated analysis, not a legal or expert determination.
- Metadata is trivially forged and stripped by most platforms on upload — its absence proves nothing.
- Any C2PA manifest was detected but NOT cryptographically validated.
- ELA is a visual aid only; texture and re-saving raise error without editing.
- The visual assessment comes from a general-purpose language model and can be confidently wrong.
